

# EVANS EZY-OVERARM ROUTER

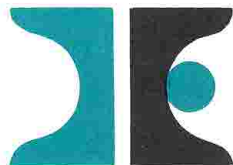

## MODEL 2475

A compact, overarm router—small producers can afford it; big producers can use it. New template hold-down configuration allows easier changing of templates and eliminates the use of expensive vacuum hold-downs. Space saving design requires half the room of earlier models. Ball bearing operation is smooth and error-free. Now, you can avoid the expense associated with high frequency routers and changers. There is no significant loss of rpm under load conditions with this new model. It's great for cutting Corian, too. Designed to handle high volume, but priced so anyone can afford it.
